Assignment 2

Waterfall Method

Waterfall method:

For the waterfall method we would begin with looking at the design parameters and agree on the specific functionality we want for each aspect of the program and from there decide who was responsible for doing what. Next we would create a data base with users. Next we would create the classes for the types of users and give them the proper methods based on the available actions for each user and test that each method works independently. Next we would create a basic user interface in the main code to see if all the individual components work together. Next we would create a more elegant user interface then test everything together and get user feedback. Finally we would implement the user feedback and preform whatever maintenance is needed.
