Assignment 2

Integrate and configure:

For the integrate and configure we would begin with creating specifications for all the specific functions of the program and break down who is responsible for what and when each aspect needs to be done by. We would then work on building on the classes and methods we created for our last assignment and give them more functionality integrating the database we will create. We can use tutorials for SQL in python to help create the database. We will then test the basic functions of the database and the classes and methods integrated together. The next step will be to add a GUI using online resources and integrating it with the rest of the project. We will then test the entire project and edit what needs to be changed
